## Career Objective

As an Electronics and Communication Engineering student with a strong passion for emerging technologies, I am eager to leverage my knowledge and skills in IoT, robotics, and VLSI design to contribute to innovative projects that push the boundaries of automation and connectivity. My goal is to join a dynamic organization where I can continuously learn and grow while designing cutting-edge solutions to real-world challenges.

## Educational Qualifications

| Degree and Year          | Institute Name                                                     | Board / University | % / CGPA |
|--------------------------|--------------------------------------------------------------------|--------------------|----------|
| B. Tech (ECE) in 2026    | Gandhi Institute of Engineering and Technology University, Gunupur | GIET UNIVERSITY    | 8.49     |
| +2 Science in 2022       | Junior Science College, Gudari                                     | CHSE               | 60.66%   |
| 10 <sup>th</sup> in 2020 | Government Nodal High School, Gudari                               | BSE                | 62.83%   |

## Training / Certification

- ❖ Certificate of participation on **Automation Nodes Workshop**
- ❖ NPTEL certification on **Cloud Computing**

## Achievements & Extracurricular activities

- ❖ Attended a two days workshop on **“Simulation Design using Proteus Software”**.
- ❖ Participated in **“District Level Yuva Utsav”** science mela event.
- ❖ Organized a Seminar **“Exploring Future Computing and Communication through Quantum Vision”** at GIET University.

## Technical Skills

- ❖ **Languages:** Python, SQL, Embedded C.
- ❖ **Genetic Software:** MS-Word, MS-PowerPoint.
- ❖ **Soft Skills:** Team Collaboration, Communication Skills, Adaptability

## Internship Programs

- ❖ Completed an internship with **Internshala on VLSI design**.
- ❖ Completed internship at **Robocoupler on Embedded System**.

## Project Details

|                     |                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name of the Project | Ultrasonic Detection System                                                                                                                                                                                                                                                                                                       |
| Apparatus Used      | Ultrasonic Sensor, Arduino, Servomotor.                                                                                                                                                                                                                                                                                           |
| Description         | This research focuses on creating an ultrasonic radar system using an Arduino Uno, ultrasonic sensor, servo motor, and software. The system can detect objects with a 40cm recognition range and robotic angular rotation. The Arduino based radar system reduces power consumption and connects programmers to open-source code. |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name of the Project | Smart Helmet System                                                                                                                                                                                                                                                                                                                                                                            |
| Apparatus Used      | NodeMCU, MQ3 Sensor, Buzzer, Push Button                                                                                                                                                                                                                                                                                                                                                       |
| Description         | Designed and implemented a real-time safety monitoring system for two-wheeler riders. The smart helmet integrates an MQ3 alcohol sensor to detect the rider's alcohol consumption and a push-button mechanism to confirm helmet usage. Using the NodeMCU microcontroller with built-in Wi-Fi, the system processes sensor inputs and determines whether the ignition signal should be allowed. |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name of the Project | Arduino-MATLAB Sensor Integration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Software Used       | Proteus, MATLAB, Arduino                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Description         | This research focuses on an integrated system that leverages Arduino, Proteus simulation, and MATLAB to collect and analyse real-time sensor data. The system utilizes a potentiometer, ultrasonic sensor, and soil moisture sensor to gather data, which is then transmitted via serial communication to MATLAB for real-time analysis and visualization. This project demonstrates reliable interaction between Proteus simulation, Arduino hardware, and MATLAB, showcasing a robust IoT-based sensor monitoring system. |
